RETIREMENT READINESS

Javier Castillo, Joaquin Castillo, Jose Torres, Abcde Mireles

TEAM ROLES

- Javier Castillo – Team Lead
- Jose Torres – Data
- Joaquin Castillo – AI Dev
- Abcde Mireles - UI

PROBLEM + TARGET USERS + SOCIAL IMPACT GOAL

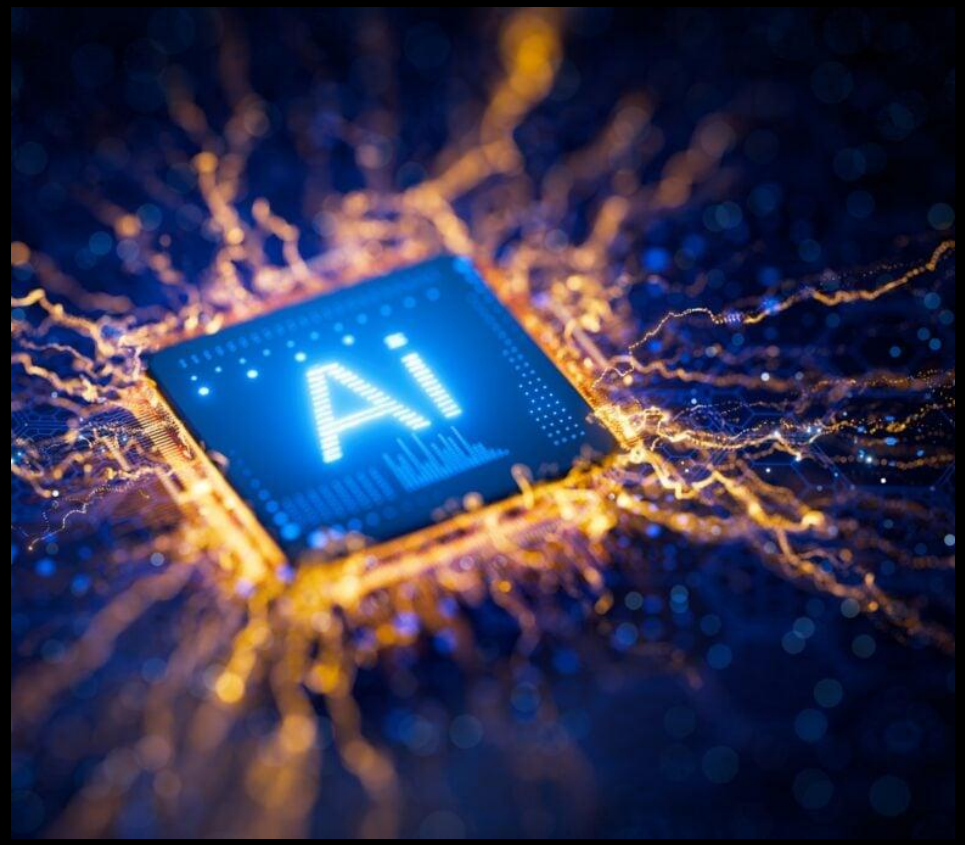
Problem: Millions of people in the United States struggle with retirement. People either do not have enough money saved for retirement or have no retirement plan.

Target Users: (1) Working adults who want to start or optimize retirement planning but lack access to financial education, and (2) adults near retirement.

Social Impact: Educate users on retirement to reduce financial insecurity later in life.

WHY AI?

- AI can analyze multiple factors simultaneously such as income and expenses to help individuals understand their potential retirement outcomes
- AI can turn complex financial concepts into simple explanations
- AI can adapt to each user's unique goals and questions



AI MODEL

<u>Generative AI model:</u>
Gemini

The AI will feel friendly and approachable

This will be able to analyze user inputs, patterns, and create relationships between variables.

Educate retirement concepts in a simplified manner

DATA PLAN

- Data will come from public APIs and government databases

  we will manually curate financial planning rules.

- Data will be cleaned to remove errors, and organize it by key factors like age, income, savings, expenses, years to retirement, and risk tolerance.
- User data entered in the app will be processed in real-time but not stored, ensuring privacy.

RISK & ETHICS

- Bias: Should test across diverse income levels, backgrounds and age groups.
- Privacy: Users will enter minable information about their finances. The product will not store this information and provide clear privacy usage policies.
- Misuse: We will not force the user to make financial decisions, only giving out financial education.
- Safety: Thorough testing will be conducted, conservative estimates will be provided, and calculations will be validated against financial formulas.

MINIMUM VIABLE PRODUCT BY MILESTONE 2

- Full Python support for communication between back-end & AI model
- Front-End Application – Working proof of concept
    - Implementation of user inputs
    - Cross communication between front-end and back-end languages
    - Receiving input from AI model

SUCCESS METRICS

- Deciding and figuring out all programming languages we are going to implement
- Focusing on user satisfaction
- Financial accuracy (must be mathematically correct)
- Providing a simple UI interface

TIMELINE

3 Mar.

Milestone 1

- Working proof of concepts between front-end, back-end, and AI model

5 Apr.

Milestone 2

- Implementations of user input communicating between front-end and back-end

20 Apr.

Clean-Up

- Finish requirements of the project, clean up code, and make application visually appealing

29 Apr.

Demo Day

- Deliver a fully working and polished product that hits all requirements of the project
